

Horticulture Aquaculture Team – Charles Darwin University

Greening the office environment

Replacing its ageing irrigation system gave Charles Darwin University's Horticulture Aquaculture Team the opportunity to save water and demonstrate new technologies.

The team installed an underground water catchment system under its plant nursery to catch and re-use excess irrigation water and wet season rain.

Since it became fully operational late last year, the system has saved 675,000 litres of water – as well as showcasing the technology for industry and the wider community.
